

Climate Change – Don't Blame CO2

Carbon Dioxide (CO2)

CO2 is only one of many climate drivers:

Sun's Heat	Ocean Currents
Sun's Magnetism	Plate Tectonics
Orbital Eccentricity	Location of Continents
Earth's Tilt	Elevation of Land Masses
Earth's Wobble	Chemical Weathering
Water Vapor	Volcanism
Carbon Dioxide	Extra Terrestrial Impacts
Methane	Fauna and Flora
Ozone	Albedo
Nitrous Oxide	Atmospheric Circulation
Aerosols	Cosmic Rays

Benefits of increased CO2:

- More Plant Growth
- Plants need less water (very helpful in drought conditions)
- Certain health-promoting substances, like vitamin C and antioxidants, are increased
- More food production per acre
- Habitats and ecosystems have higher plant and wildlife capacity
- Greening of earth extends into deserts, as plants become more drought tolerant
- Plants can better resist various stresses
- Forests dramatically increase in growth, helps them recover from recurring natural disasters
- Earth's greatest airborne fertilizer
- Staff of life for earth's plant kingdom, which is the beginning of the food chain; without it there would be no life on earth
